Hiring Team
Industrial Scientific (Fortive)
Mid-Level Full Stack Engineer

Dear Hiring Team,

I'm writing to apply for the Mid-Level Full Stack Engineer role at Industrial Scientific. Your mission of ending death on the job by 2050 is the kind of purpose-driven engineering work I'd genuinely value being part of, and the scope of this role – building UIs and APIs, owning data access layers, working across AWS – lines up closely with how I like to work as an engineer.

My background is centered on React, Next.js, and TypeScript, with 3+ years of hands-on frontend development and full-stack depth I've built over the past year in Node.js, Express, PostgreSQL, Redis, and Docker, including CI/CD pipelines deployed on AWS. At Maxbridge Solution LLP, I led a six-member engineering team delivering production systems for government and healthcare clients, including a GIS-based land mapping platform and two healthcare applications live on both major app stores with biometric authentication integration.

I want to be upfront about one gap: my production experience is in the Node.js/Express ecosystem rather than .NET and C#. I recognize your posting lists full-stack experience with both React/Next.js and .NET C# as a required qualification, so I understand this may not be a fit as-is. That said, my API design, Entity Framework-equivalent data-access patterns (via Drizzle ORM and raw SQL), and backend architecture experience transfer directly, and I'm confident in my ability to ramp up on C#/.NET quickly given a strong foundation in object-oriented design and modern backend practices. I'd welcome the chance to discuss whether that trade-off works for your team.

Thank you for your time and consideration.

Sincerely,

Subham Paul
